

WellConnect Software

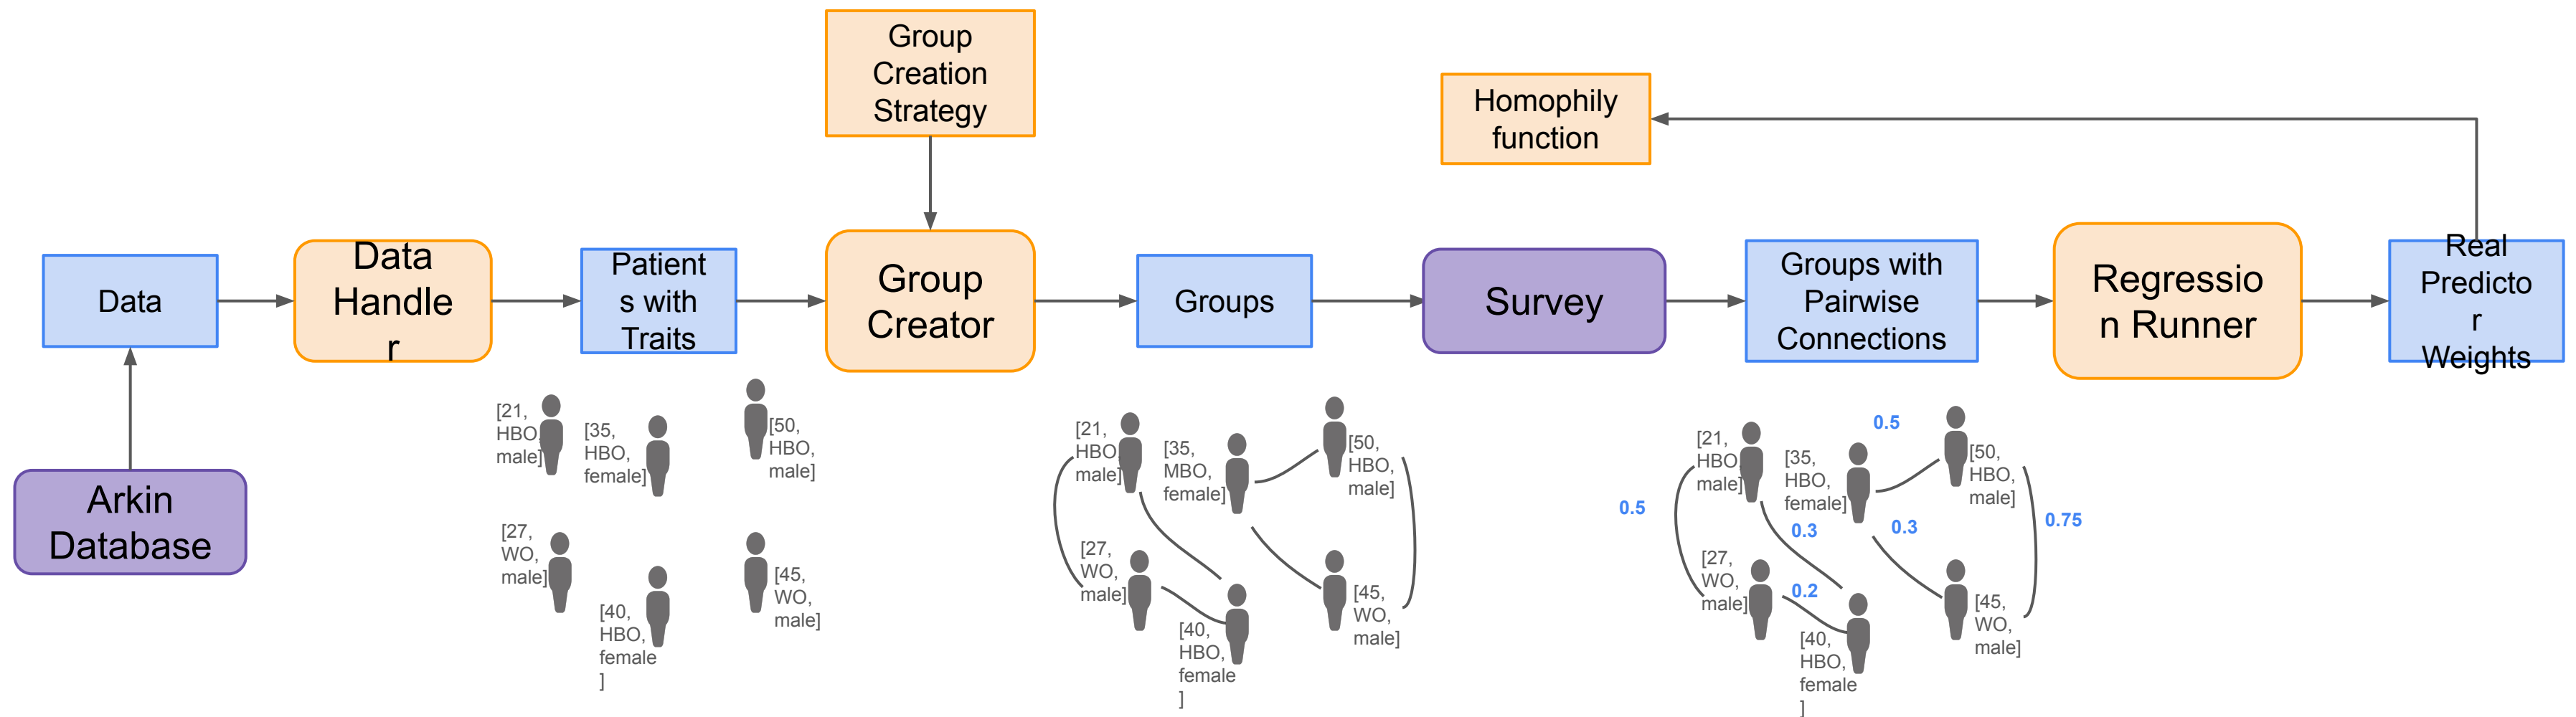

Pilot, Cohort and Experiments

WellConnect Software: Pilot Study

But... what are the real predictor weights? $\Rightarrow$ Cohort Study

WellConnect Software: Cohort Study

But can we always find the real predictor weights?

Example

Example Input Weights:

Age = 0.33

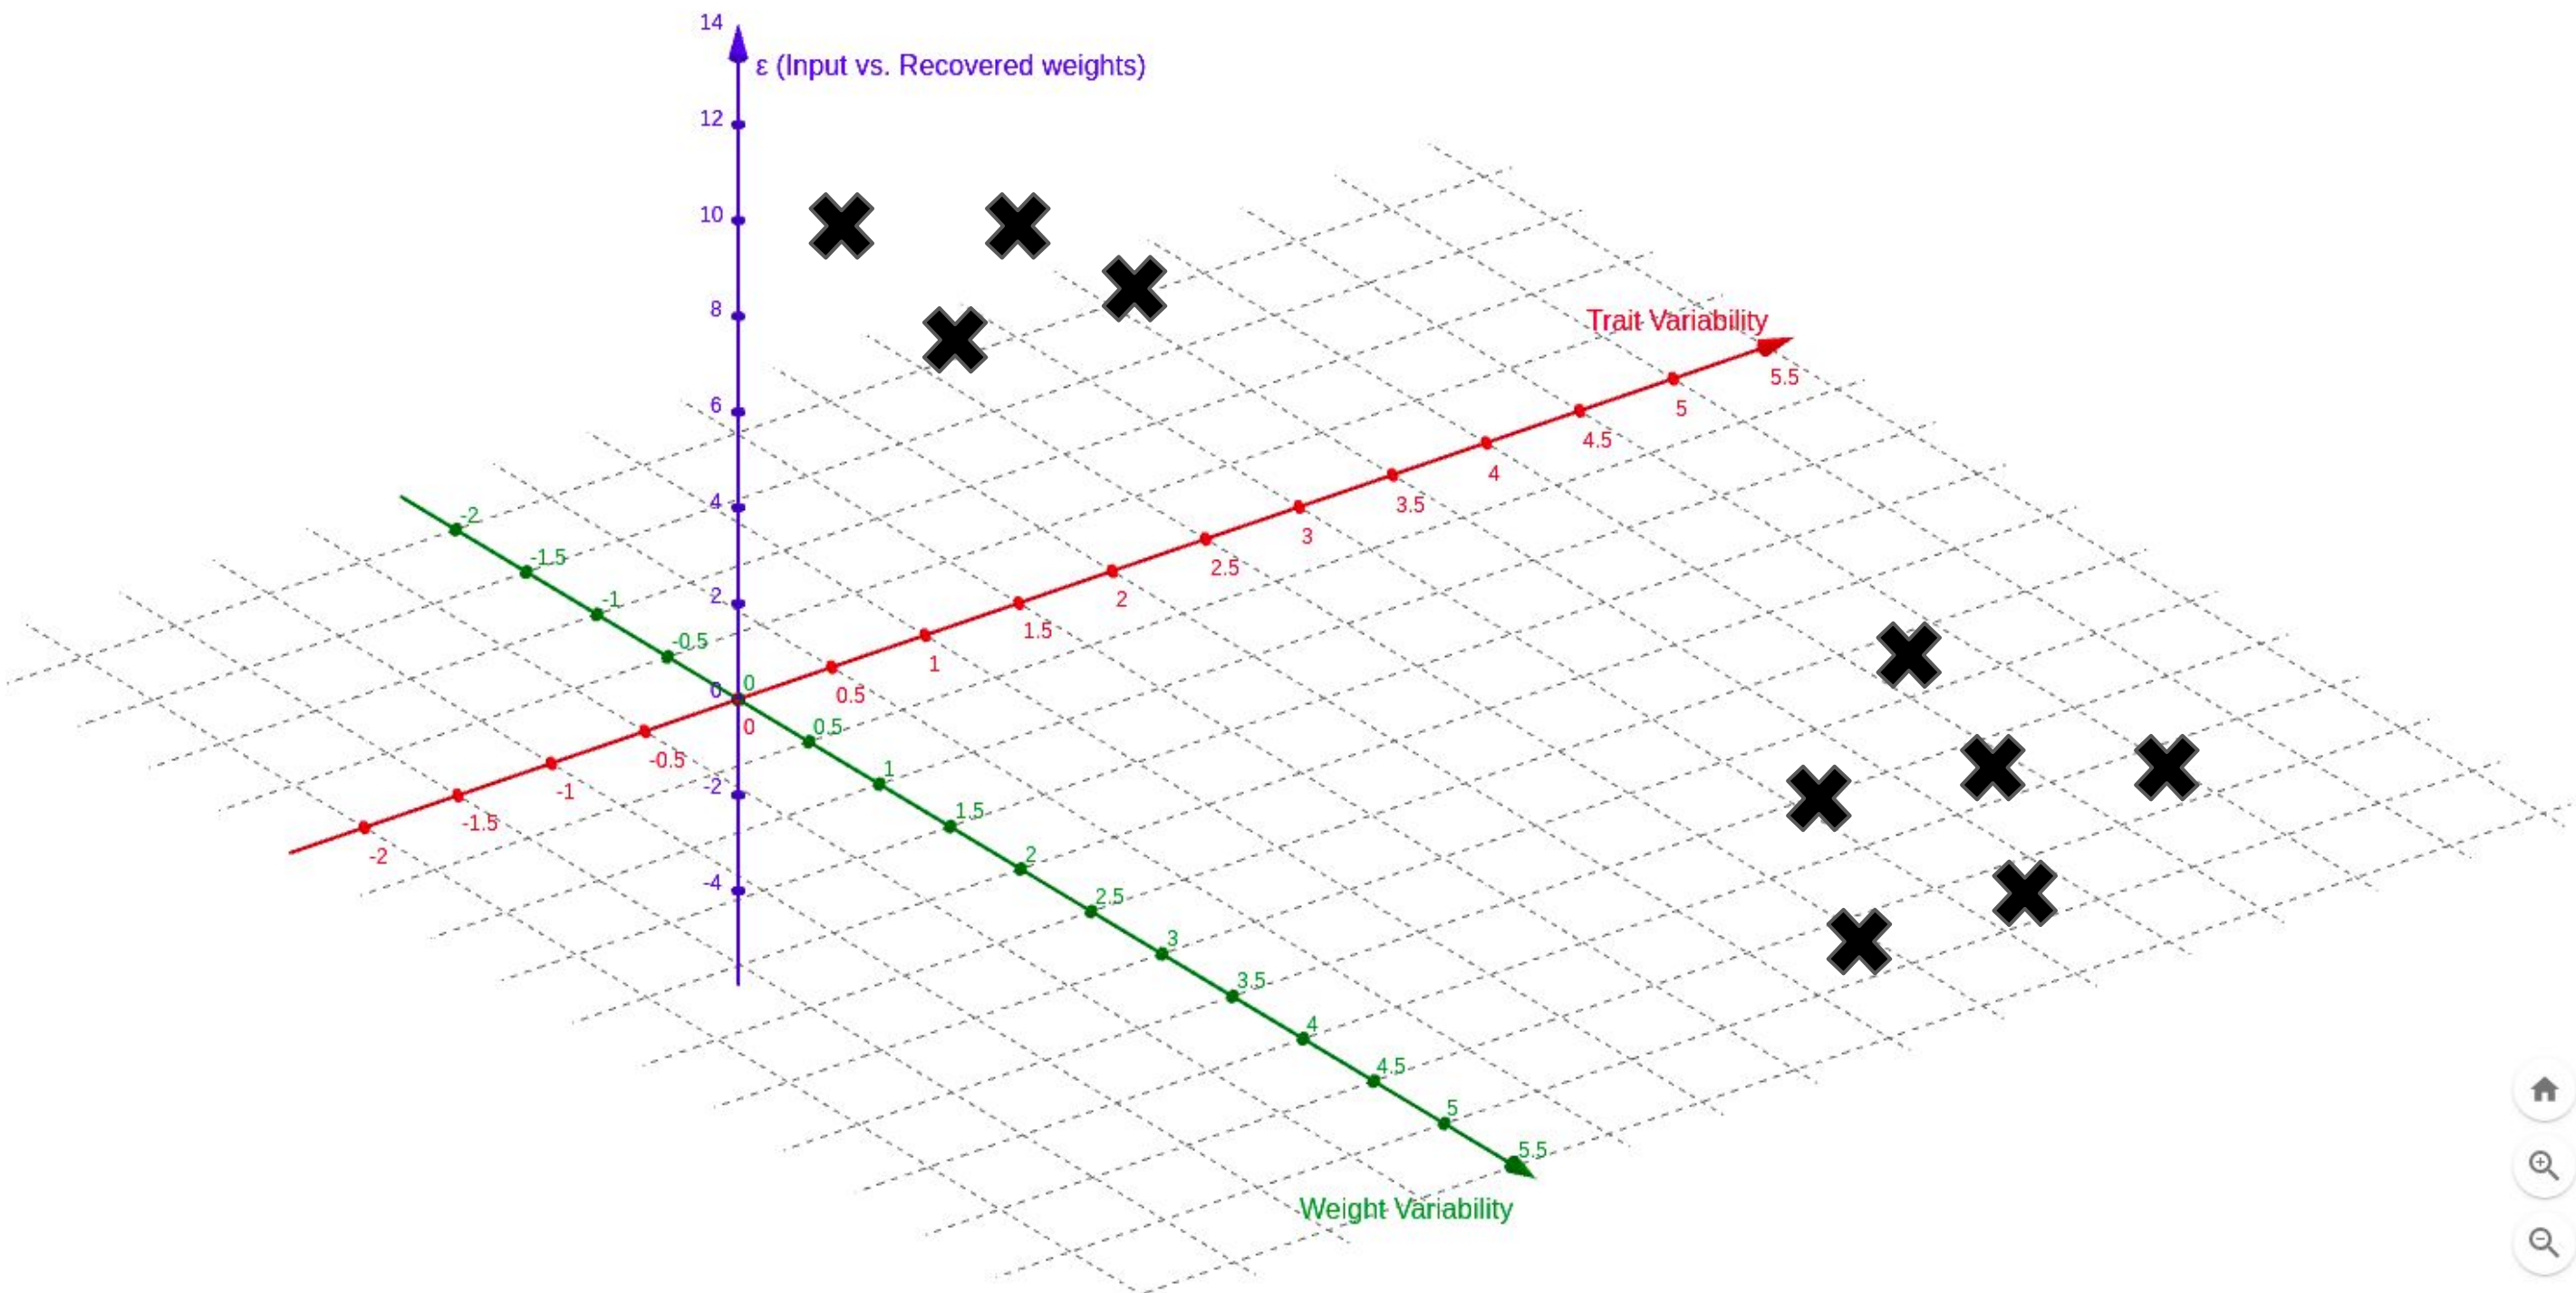

Education = 0.33

Gender = 0.34

How can we avoid this happening in the Cohort Study? $\Rightarrow$ Experiments (running different scenarios beforehand)

Recovered Predictor Weights			
Group ID	Age	Education	Gender
1	0.50	0.50	0
2	0	1.00	0
3	0.5	0.5	0
4	0.5	0.5	0
5	0.5	0.5	0
6	0.5	0.5	0
7	0.5	0.5	0
8	0.5	0.5	0
9	0.5	0.5	0
10	0.33	0.33	0.34

Expected Experiment Output

Software: Experiments before the Cohort
